RE: Inspection of mine site preparation for
Getty Mineral Resource Company
Mercur Canyon Project
ACT/045/017
Toole County, Utah

On Friday, November 13, 1981, Tom Tetting, Tom Portle, and Susan Linner of the Division met on site with Brian Buck, the Getty representative. A brief tour of current contracted earth moving activities was conducted. The majority of work is being finished on the mill site area before the snow falls. Temporary sedimentation control was in place and consisted of a small pond, berms and straw bale filters. The topsoil stockpile appeared well established and quite out of the way. It had not yet been seeded.

Hydromulch was in the process of being applied to road cuts. The new large road has been completed up the canyon from Rush Valley replacing the old one. The ephemeral stream channel has been relocated and culverting under the road at several spots has been undertaken. The Road was being sprayed with water for dust suppression at the time of the visit.

Excellent progress is being made and no further action necessary.

TOM N. TETTING
ENGINEERING GEOLOGIST
